                                                                                                                                                                                                                                                                                                                                                                                                                                               is useful for predicting the potential of an oligonucleotide to hybridise to a target nucleotide sequence, e.g. RNA or DNA or a sequence that contains chemically modified nucleotides. The method is also useful for predicting the potential of the oligonucleotides to hybridise to a complementary target nucleotide sequence. The method is useful to predict efficient hybridisation oligonucleotides for each of multiple target sequences therefore very large arrays may be constructed and tested with minimum synthesis of oligonucleotides. The present sequence represents a HIV PRT antisense derived probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Predicting potential of oligonucleotides to hybridize to target nucleotide sequence comprises determining and evaluating for each oligonucleotide a parameter predictive of the oligonucleotides ability

oligonuclectides to hybridise to target nuclectide sequences. The method is useful for predicting the potential of an oligonuclectide to hybridise to a target nuclectide sequence, e.g. RNA or DNA or a sequence that contains chemically modified nuclectides. The method is also useful for predicting the potential of the oligonuclectides to hybridise to a complementary target nuclectide sequence. The method is useful to predict efficient hybridisation oligonuclectides for each of multiple target sequences therefore very large arrays may be constructed and tested with minimum synthesis of oligonuclectides. The present sequence represents a HIV PRT antisense derived probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI;

polymorphism in the ESE-3, ESE-2 or ESE-1 genes, which is correlated with an alteration in the activity or expression of a polypeptide encoded by these genes. Detection of the polymorphism is indicative of the occurrence, predisposition or susceptibility to autoimmune disease. The method is useful for diagnosing the presence, predisposition to, or susceptibility to an autoimmune disease, e.g. diabetes (e.g. Type I diabetes or Type II diabetes), multiple sclerosis, rheumatoid arthritis, lupus, psoriasis, asthma, myasthenia gravis, Sjogren's syndrome, Hashimoto's thyroiditis, Pemphigus vulgaris, or inflammation (e.g. the atheroselerosis, rheumatoid arthritis, or inflammation associated with restenosis). The method is also useful for preventing or treating any of these diseases. This sequence corresponds to a primer used in the method to detect the single nucleotide polymorphisms in the ESE genes,

predisposition or a susceptibility to the disease, polymorphism in the ESB-3, ESE-2 or ESE-1 genes, \mathbf{w}

The invention relates to the diagnosis of

an autoimmune

γď

detecting a

disease,

                                                                             The present invention relates to a method (M1) for determining a CC predisposition for or the occurrence of neurodegenerative disease in a CC subject. The method comprises detecting in a target nucleic acid obtained from the subject the presence or absence of an allelic variant of one or CC more polymorphic regions of one or more genes selected from upA (Urokinase plasminogen activator), SNGG (gamma-synuclein), IDE (insulin-CC lypase), and TNFRSF6 (Tumour Necrosis Factor Receptor-SP6), where the presence of at least one of the allelic variant of one or more CC polymorphic regions is indicative of a predisposition for or the CC cocurrence of neurodegenerative disease. The genes are all located on CC chromosome 10, M1 is useful for determining a predisposition for or the occurrence of, and for treating neurodegenerative disease, particularly Alleimer's disease. The present sequence is a PCR primer, which was used

Assay for detecting genotype of AZT resistance - utilises probes which anneal to amplified region of HIV-1 gene. series o m

Disclosure; Page 17; 57pp; English.

The sequences given in AAQ29591-601 are sequencing primers which were used in the method of the invention to determine the sequence of regions of the HIV pol gene which are involved with resistance to azidothymidine (AZT). Resistance to AZT is caused by the accumulation of four mutations grouped within two regions of the HIV pol gene. The primers AAQ29591-96 are used to determine the sequence around the mutations at amino acids positions 67 and 70, and primers AAQ29597-601 are used to determine the sequence around the model to determine the sequence around the mutations at a mino acids positions 67 and 70, and primers AAQ29597-601 are used to determine the

                                           The oligonuclectides (See AAQ79201-52) can be used to treat viral infections. The oligonuclectides inhibit viral replication by forming guanosine tetrads which form a stabilised 3D structure. Preferred oligonuclectides contain at least 2 runs of at least 2 guanosine bases and may be capped at the 3' terminus with a modifier selected from polyamine, poly-lysine, cholesterol and propanolamine. They may also have a modified phosphodiester linkage or be modified to contain a phosphorothicate linkage. They are used to treat infections with viruses such as herpes simplex virus, human papilloma virus, Epstein-Barr virus, HTV, adenovirus, respiratory syncitial virus, hepatitis B virus or human cytomegalovirus.                                                                                                        AAT16454-T16469 are PCR primers used to amplify human p53 genomic DNA. The primers are used to demonstrate a method of sequence-based diagnosis of a human neoplastic tissue, blood or other body fluid. The method determines the presence, nature and location of any mutations and their influence on the biological function of the p53 protein (or other cancerrelated protein), and hence the properties of the neoplasia (e.g. metastatic potential). The method allows a reliable, accurate diagnosis of neoplasia, allowing clinicians to form a prognosis on the development of the neoplasia and guidance for its treatment
                                                                                       Sequence 21
                                                                                                                                                                                                                                             Sequence-based diagnosis of a human neoplastic tissue, blood fluid - useful for the diagnosis or prognosis of neoplasia.

The oligonucleotides may form guanosine tetrads (structures formed of eight hydrogen bonds by coordination of the four oxygen atoms of guanine with alkali cations believed to bind to the centre of a quadruplex, and by strong stacking interactions) and are used to prevent the integration of viral nucleic acid into a host genome. The oligonucleotides inhibit functioning of the integrase enzyme and hence prevent viral infection. Viral infections that may be treated include human immunodeficiency virus (HIV), Epstein Barr virus (EBV), herpes simplex virus (HSV), human papilloma virus (HPV), adenovirus, respiratory syncytial virus (RSV), cytomegalovirus (CMV) and hepatitis B virus (HBV), especially HIV-1 infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                19-JUL-1995;

(A) is single-CC stranded and is designed to hybridise to complementary target sequence CC promoter. (C) is single-or domain B. It consists of a nucleotide CC for the promoter activity of domain B. It consists of a nucleotide CC sequence not found in the template. The DNA construct is used in a method CC for detecting and quantifying an oligonucleotide analyte or a ligand CC receptor by amplification of a biological signal in a nucleic acid CC nucleic acid segments characteristic of hepatitis B virus, Neisseria CC nucleic acid segments characteristic of hepatitis B virus, Neisseria CC microtioneae, bacterial beta-lactamase TEM-1 gene, Chlamydia, bacterial CC the pilin gene DNA of Neisseria gonorrhoeae was performed using a CC microtitre dish assay procedure and the T7 RNA polymerase. The present CC con 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          02-FEB-1996;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A forward primer (AAT80146) and a reverse primer (AAT80147) were used for the PCR amplification of the immunoglobulin (Ig) signal sequence from template plasmid pSP72IGG1. The reverse primer corresponds to the C-terminal of the natural Ig signal peptide. The 208 bp PCR product contains the entire Ig signal sequence. Novel CTLA4-antibody fusions have the heavy and light chain variable domains of an antibody molecule replaced with the extracellular domain of CTLA4. The resulting antibody-like protein binds to B7-1, B7-2 and CTLA4 ligands with high affinity. Novel CTLA4-Ig constructs (see AAT80131-83) encode fusion proteins (see AAW26206-08) useful in claimed methods for suppressing an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gray

The ONs are used to inhibit the replication of viruses. They are able to suppress virus production for prolonged periods after an initial short treatment regimen. They can be used for treating pathophysiological states caused by viruses such as herpes simplex virus, human papilloma virus, Epstein Barr Virus, HIV, adenovirus, respiratory syncytial virus, hepatitis B virus, human cytomegalovirus and HTLV I and

This invention describes a novel method for identifying an inhibitor CC potentially useful for treatment of cancer, where the inhibitor is active CC on a gene vital for cell growth or viability, and where the gene is CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is CC used for preventing the development of cancer in a patient a first allele greeinfic inhibitor (ASI) targeted to an allele of a first essential gene cC present in cells of the precancerous condition, where the normal somatic CC cells of the patient are heterozygous for the first gene, the inhibitor CC calls of the patient are heterozygous for the first gene, the inhibitor CC calls of the patient are heterozygous for the first gene, the inhibitor CC cells of the gatient are heterozygous for the first gene, the inhibitor CC cancers in a population and targets only one allelic form present in the CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic CC lesions, benign tumours, endometriosis, polycystic kidney disease, and CC graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent contacts.

The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ2581-z25625 represent human polymorphic sites described in the method of the invention
This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is action a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polymorphism; human; inhibitor; cancer; treatment; cell growth; LOH; cell viability; loss of heterozygosity; precancerous condition; ASI; atlele specific inhibitor; somatic cell; diagnosis; prevention; atherosclerotic plaque; premalignant metaplastic lesion; endometriosis; dysplastic lesion; benign tumour; polycystic kidney disease; transplant graft versus host disease; malignant cell removal; bone marrow; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence

밁 ঠ

used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is ac on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is

٦. 8 active

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is dictive on at least one but less than all allelic forms of the gene present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent human polymorphic sites described in the method of the invention
                                                                                                                                                                                                Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is considered to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) traggeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic collesions, benign tumours, endometriosis, polycystic kidney disease, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atheroscierotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplance, AAZ25812-Z26825 represent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       នន្តន្តន្ត
                                                                                 CC This sequence represents a PCR primer for a barley chromosome 7 CC microsatellite marker, and can be used in the method of the invention. CC The method is for screening cereal for fermentability, comprising careal for screening cereal for fermentability, comprising careal for screening chromosome of a gene/gene CC complex affecting fermentability at a locus close to the centromere on the homologous Triticeae group 5 chromosome (barley chromosome 7) is/are CC present. The invention also relates to a method for screening cereal for CC comprising analysing barley genomic DNA to determine which allele(s) of the locus, designated eph on the short arm of homologous Triticeae group 1 chromosome (barley chromosome 5) is/are present. The methods and CC primers are useful for identifying microsatellites Bmac96 and Bmac213, which are useful for determining fermentability and/or epi-heterodendrin production in cereals, especially barley. Current methods for determining fermentability are difficult to apply within barley breeding programs.

CC Prior art methods using molecular markers have difficulty in detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ঠ
                                              CC CNS glial-restricted precursor (GRP) cells which can self-renew in the CC AFCI culture medium and can differentiate to CNS glial cells but not to CC CNS enuronal cells. The stem cells can be used to generate a population CC computing cell proliferation and neuronal differentiation. The medium CC promoting cell proliferation and neuronal differentiation. The medium CC comprises laminin-coated plates and NEP medium lacking chick embryo CC extract. The stem cells can also produce neural crest stem cells by CC inducing the cells to differentiate in vitro. The inducing step comprises CC replating the cells on a laminin-coated substrate and preferably CC withdrawing a mitogen (preferably fibroblast growth factor; FGF) and CC chick embryo extract. Inducing can also comprise adding a dorsalizing CC agent to the cells, preferably a bone morphogenetic protein (BMP) such as CC BMP-2, -4 or -7. The stem cells can be used to produce cells of the CC vitro to neural crest stem cells can be used to produce cells of the CC vitro to neural crest stem cells, and inducing these cells to differentiate in CC comprises adding the stem cells to an example from the present invention to amplify different FGF and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an isolated, pure population of mammalian neurospithelial stem cells, which are capable of self-renewal in adherent feeder-cell-independent (APCI) culture medium and differentiation to central nervous system (CNS) neuronal or glial cells and to neuronal crest stem cells. Also described is an isolated population of mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mammalian neuroepithelial stem cells and glial restricted precursor - self renew and differentiate into central nervous system cells, used generating various types of cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Neuroepithelial stem cell; lineage restricted intermediate precursor; oligodendrocyte; astrocyte; self-renewal; neuron; differentiation; neural creat cell; fibroblast growth factor; FGF; FGFF; receptor; CNS; central nervous system; glial cell; PCR primer; amplification; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 1999-070093/06.

                                                                            Query Match
                                                                                                                          The present sequence is that of the forward primer used in the real-time quantitative PCR amplification of cancer specific gene Pro111 (see AAZ95002 and AAZ95003). Overexpression of Pro111 was found in 5 of 16 primary prostate cancer samples examined, indicative of it being a diagnostic marker for prostate cancer. The invention provides ESTs and full-length contigs for CSGs (see AAZ94998-Z95017). The CSGs, polypeptides encoded by them, and antibodies that specifically bind CSG are used in claimed methods for detecting, diagnosing, monitoring, staging, imaging and treating prostate cancer

The protein is an IPM component (IPMC). Two subfamilies of IPMCs, IPM150 and CC protein is an IPM component (IPMC). Two subfamilies of IPMCs, IPM150 and CC IPM200, exist. The human IPM150 gene is located on chromosome 6q13-q15, component a patients own production of the protein or to rectify CC to supplement a patients own production of the protein or to rectify CC alterations in their nucleic acids that result in expression of an CC inactive protein. The IPM nucleic acids may be used in this way to treat CC ocular diseases such as retinal detachment, chorioretinal degeneration, cone CC retinal degeneration, age related macular degeneration, cone CC degeneration, mucopolysaccharidosis, rod-cone dystrophy and cone-rod CC degeneration, mucopolysaccharidosis, rod-cone dystrophy and cone-rod CC dystrophy. The nucleic acids and proteins may also be used to treat ocular diseases. The nucleic acids and proteins may also be used as diagnostic resgents to detect the presence of IPM nucleic acids and proteins from their receiptor and contact of the proteins may also be condition.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      21-APR-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            invention, which contain a polymorphic base at position 24 of their nucleotide sequences. ARZ65579 to ARZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not accually given a sequence in the Sequence Listing from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

The method involves CC detecting a polymorphism in a human interleukin-10 (IL-10) promoter, CC where the presence of the polymorphism indicates susceptibility to HIV CC infection or HIV progression. The method provides prognostic information CC to persons infected with HIV virus and is useful to help select treatments (such as administration of IL-10 or gene therapy with IL-10). CC The presence of polymorphism is useful as predictor that very aggressive treatment could substantially eradicate the virus from the infected CC predictive algorithms that can be used, in association with allele CC status, to prognose probable survival or years to development of AIDS CC following HIV seroconversion. It indicates that increased expression of the IL-10 gene helps to reduce HIV-1 infection and pathogenic progression CC and enables a variety of new therapeutic interventions in the treatment CC of HIV disease. The present sequence represents a short tandem repeat CC (STR) primer which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The present invention relates to a method for the locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles. The method is useful for subtyping or typing of HLA class 1 alleles. The present sequence is an amplification primer used in the method
                                                                                                                                                                                                                        Locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles using defined primer sets, useful for subtyping or typing of HLA Class I alleles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Reverse primer #97 used for amplification of HLA-A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forent myocardial infarction; atherosclerosis; stroke; venous thromboe
                                                                                                                                             The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart
                                                                                                                                                                                                                                                                                                                                                          Nucleic acids comprising single nucleotide polymorphisms, useful applications such as forensics, paternity testing, medicine, gene analysis and phenotype correlations to diseases such as diabetes
                                     disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human gene single nucleotide polymorphism #81.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                06-JUN-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAF95320

                                                                                                                                                                                                                                                                                               genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4

                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosolerosis, myocardial infarction, coronary heart diagnosis of atherosolerosis, myocardial infarction, coronary heart
                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                             pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in foremsics, paternity testing, genetic analysis and phenoty correlations to diseases. The present sequence is an example of one the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Lander ES,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (WILL-)

CC in angiogenesis (1), and the polypeptides that encode them. (1) have angiogenesis. The nucleic acids and polypeptides may be used in the cardiovascular activity, and can be used in the modulation of angiogenesis. The nucleic acids and polypeptides may be used in the cardiovascular diagnosis and treatment of diseases associated with the production of antibodies against them and in assays to identify and the production of antibodies against them and in assays to identify and antagoniste may also be used as antipodies and activity. The antibodies and activity and contragoniste may also be used to down regulate expression and activity and contragoniste may also be used as diagnostic modulate angiogenesis. The antibodies may also be used as diagnostic constructs for detecting the presence of the polypeptides in samples. The production poliferative tumours, considered with neovascular tumours, proliferative tumours, considered with neovascularisation, peripheral vascular disease. The production, inflammatory vasculitides, Reynaud's disease and considered with neovascularisation, peripheral vascular disease, in phenomenon, aneurysms, arterial restenosis, thrombophlebitis, conditions, heart failure such as congestive heart failure, age-related conditions, heart failure such as congestive heart failure, age-related conditions, heart failure such as congestive heart failure, age-related conditions, chronic heart failure such as congestive heart failure age-related failure, age-related in the exemplification of the present failure such as congestive heart failure, age-related failure failure

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                             Matches
                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                       DNA sequences AAH62100 - AAH62688 represent segments of human genes which contain single nucleotide polymorphisms (SNPs). A method is included in the invention for analysing a nucleic acid sample, which consists of determining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart adiseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Single nucleotide polymorphism; SNP; human; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CHRNA7 polymorphism containing DNA fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid segments of the human genome, particularly from including polymorphic sites, for phenotype correlation, forensics, paternity testing, medicine and genetic analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Homo sapiens

A method is included in the invention for analysing a nuclei acid sample, which consists of determining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in
Human; inflammatory bowel disease; Crohn's disease; ulcerative colitis; single nucleotide polymorphism; SNP; chromosome 19p13; paternity test; chromosome 5q31-33; forensic test; gene therapy; ds.
                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid segments of the human genome, particularly from genes including polymorphic sites, for phenotype correlation, forensics, paternity testing, medicine and genetic analysis.

                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a method for detecting the presence polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to determine the presence of genetic polymorphisms associated with inflammatory he disease and correlating their occurrence with disease states. They mused in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a

This sequence represents a sequencing primer used within the scope of the cinvention. The invention relates to a method for preparing definitive ectoderm equivalent (DEE) cells in vitro comprising providing: (a) early CC primitive ectoderm-like (EPL) cells; and (b) a conditioned medium or CC extract exhibiting neural inducing properties and culturing the EPL cells for a time to permit controlled differentiation to DEE cells. The DEE CC cells, or their differentiated or partially differentiated progeny are useful in human cell therapy or transgenic animal production and for use in human or animal gene therapy. The method is useful for preparing DEE Cc cells in vitro. It can also be used for selectively producing neuroectoderm cells or surface ectoderm cells from DEE cells. The method CC useful for preparing tissues or organ for transplant. The cells are useful for preparing tissues or organ for transplant. The cells are creating and curing neurodegenerative diseases such as such as stroke and spinal cord injury by replacing or assisting the treation of normal disease tissues. They are also useful for the cells as source for reprogramming and for use in pharmaceutical or transplant.

```
The present invention relates to a method for classification and quantitative determination of enzymes participating in glucuronic acid conjugation. The method involves the use of oligonucleotide probes hybridising to regions of the human UD-glucuronosyltransferase (UGT) genes (e.g. UGT1, UGT1A7, UGT1A9, UGT1A10, UGT2A1, UGT2B7, UGT2B10, UGT2B11, UGT2B15, UGT2B17, UGT8), and the DDOST gene. The method and probes are useful for the genetic determination of enzymes participating in glucuronic acid conjugation with catalysed UGT. The method is both rapid and accurate. ABK51813-ABK51836 represent oligonucleotide probes useful for human UGT or DDOST genes

Diagnosis and identification of panic disorder caused by polymorphism of upper stream region of human cholecystokinin gene.

Claim 6; Page 6; 13pp; Japanese.

The invention describes a method of diagnosing a panic disorder with polymorphism of the upper stream region of human cholecystokinin (CCK gene. This sequence represents a human cholecystokinin gene associate PCR primer associated

Sequence 21 BP; σ ₽ 5 C; 4 G; 6 T; 0 U; 0 Other,

                                                                                                                                                                                                                                           The invention relates to a host cell, made to express an insoluble or aggregated protein having free cysteines residues. The cell is then lysed by chemical, enzymatic or physical agents and solubilised by exposing it to a denaturing agent, a reducing agent and a cysteine blocking agent, and is refolded into a biologically active form by reducing the concentrations of denaturing and reducing agents. The protein may belong to the growth hormone supergene family or may be an anti-angiogenesis factor. The method is useful for preparing a refolded, soluble form of an insoluble or aggregated protein. The proteins of the invention can act as delivery vehicles for enhancement of the circulatory half-life of the therapeutics that are attached or for directing delivery of a specific target within the body. Sequences ABK16774-ABK16852 represent PCR primers used in synthesis of the proteins

```
CC calls in which both alleles of a gene are modified, comprising modifying CC calls in which both alleles of a gene are modified, comprising modifying CC one allele by insertion or replacement by a cassette having an CC expressible selectable marker and modifying other allele by CC promoter, so that expression of the second allele is regulated by the CC promoter, which both alleles of a gene are modified. The diploid fungal CC cells in which both alleles modified are useful for identifying a gene that CC is essential to the survival or growth of a fungus, a gene that CC is essential to the virulence and/or pathogenicity of a fungus, a gene that contributes to the virulence of a diploid fungus to an antifungal agent that that inhibits the growth of a diploid fungus a gene condisease. (M1) is useful for identifying a compound which modulates the CC disease. (M1) is useful for identifying a compound which modulates the CC compound catabolism, biosynthetic, transporter, transcriptional, compound catabolism, biosynthetic, compound catabolism, biosynthetic, catabolism, bio

Novel polynuclectide of the endothelin/endothelin converting enzyme/receptors of endothelin and endothelin converting enzyme signaling system associated with cardiovascular disease, useful for treating the

Example 6; Page 67; 190pp; English

The invention describes a polynucleotide (I) of the endothelin (EDNN)/endothelin converting enzyme (ECE)/receptors of EDN and ECE (EDNR) signaling system which is associated with a cardiovascular disease. (I), the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing (I) or (II) is useful for producing cells capable of expressing a molecular variant polypeptide which is associated with a cardiovascular disease. ((II), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing a molecular variant gene comprising (I) is useful for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system

The isolated proteins and polymucleotides encoding them are useful for preparation of a pharmaceutical composition for treating a cardiovascular disease such as coronary heart disease, hypertension, attherosclerosis, or related to abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial hypercholesterolaemia. The gene or a polymucleotide fragment of the EDN/ECE/EDNR signaling system are useful as forensic markers, for creating a transgenic animal and in creation of a solid support comprising polymucleotides, genes, vectors, polypeptides, antibodies or host cells of the invention. This sequence represents a PCR primer used to identify single nucleotide polymorphisms in DNA encoding pathway cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway
                                                                                                                                                                                           Novel polynucleotide of the endothelin/endothelin converting enzyme/receptors of endothelin and endothelin converting enzyme signaling system associated with cardiovascular disease, useful for treating the
                                                                                                                                                                                                                                                                                                                                                                                                   31-AUG-2001; 2001WO-EP010087.

The invention desc (EDN)/endothelin a signaling system the gene encoding

tion describes a polynucleotide (I) of the othelin converting enzyme (ECE)/receptors system which is associated with a cardiov encoding EDN, ECE or EDNR (II) or a vector

cardiovascular disease.

expressing

of EDN endothelin

and

cc or (II) is useful for producing cells capable of expressing a molecular variant polypeptide which is associated with a cardiovascular disease. (CII), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing a cC molecular variant gene comprising (I) is useful for identifying and cC obtaining a pro-drug or drug capable of modulating the activity of a cell expressing a cC molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system cc or its gene product, or for identifying and obtaining an inhibitor of the cC activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and cC polymucleotides encoding them are useful for preparation of a polymuclar disease, hypertension, atherosclerosis, or related to coronary heart disease, hypertension, atherosclerosis, or related to hypercholesterolaemia. The gene or a polymucleotide fragment of the EDN/ECE/EDNR signaling system are useful as forensic markers, for cc comprising polymucleotides, genes, vectors, polypeptides, antibodies or comprising polymucleotides, genes, vectors, polypeptides, antibodies or didntify single nucleotide polymorphisms in DNA encoding to cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway cc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 2598

The invention describes a polynucleotide (I) of the endothelin

The present invention relates to a method for identifying compounds

 $\widehat{\Xi}$

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC the gene encoding EDN, ECE or EDNR (II) or a vector (III) stream which is associated with a cardiovascular disease. (I), CC the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing (I) cc variant polypeptide which is associated with a cardiovascular disease. (II), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing and complecular variant gene comprising (I) is useful for identifying and cobtaining a pro-drug or drug capable of modulating the activity of a cc or its gene product, or for identifying and obtaining an inhibitor of the cativity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and CC polynucleotides encoding them are useful for preparation of a phyperide of the EDN/EDR/ECE coronary heart disease, hypertension, atherosclerosis, or related to phypercholesterolaemia. The gene or a polynucleotide fragment of the EDN/ECE/EDNR signaling system are useful as forensic markers for CC comprising polynucleotides, genes or a polynucleotide fragment of the comprising polynucleotides, genes, vectors, polypeptides, antibodies or creating a transgenic animal and in creation of a solid support collentify single nucleotide polymorphisms in DNA encoding pathway or cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway or cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway or cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway or cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway or cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway or cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway or cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway or cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway or cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway or cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway or cardiovascular regulator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The present invention describes the human brother of regulator of imprinted sites (BORIS) protein. Also described: (1) a vector comprising an isolated nucleic acid encoding BORIS; (2) a cell comprising the vector; (3) an isolated polypeptide molecule comprising a sequence encoding the human BORIS or its fragment comprising at least 307 or 21 contiguous amino acids, either one of which is optionally glycosylated, amidated, carboxylated, phosphorylated, seterified, N-acylated or converted into an acid addition salt and/or optionally dimerised or polymerised; (4) a cell line that produces a monoclonal antibody that is specific for a region of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         that can stimulate a gene of the OAS (2'-5'-oligoadenylate synthase) family. The method comprises: (a) inducing expression of the OAS gene in a culture of cells from a non-human mammal (Flyr/Flyr or Flyr/Flyr; indicating resistance or sensitivity to Flavivirus infection); (b) treating cells with test compound; and (c) measuring activity of OAS gene relative to a control. (l) are potentially useful as antiviral agents for treating infections by Flaviviruses (e.g. hepatitis C; dengue; yellow fever and various forms of encephalitis). Genomic OAS DNA and derived cDNA, also the encoded proteins, are useful: (a) for treating Flavivirus infection; (b) in screening for anti-flavivirus agents, and (c) for evaluating sensitivity of subjects to Flavivirus infection and their likely response to interferon treatment, e.g. to identify patients at risk of developing severe forms of such infections. The present sequence is a PCR primer for murine OAS, which was used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                    WPI; 2003-721780/68

```

The present invention relates to a method for the direct comparison numerical gene expression values between samples of genes. The methoc comprises amplifying cDNA in the presence of a competitive template inixture and primer pairs for several genes and then amplifying alique of the PCR products using a primer pair specific for each gene. The method of amplification is by multiplex standardised reverse transcriptase-polymerase chain reaction (StaRT-PCR). High density oligonucleotide or CDNA arrays are used to measure PCR products foll quantitative StaRT-PCR. The method is useful for the assessment of g

assessment of gene

following

Direct comparison of numerical gene expression values between samples of genes comprises using multiplex standardized reverse transcription-polymerase chain reaction.

BORIS has cytostatic activity, and can be used in gene therapy. A nucleic acid encoding BORIS can be used for preparing a composition for treating or preventing cancer. The present sequence represents a PCR primer corresponding to human BORIS and murine CTCF used to identify murine BORIS, which is used in an example from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               expression in small biological samples such as fine needle aspirate biopsites, and laser captured microdissected materials. The method allows for the standardised measurement of hundreds of genes from the same sample, which in prior art, could only be assessed for one gene. The present sequence represents a multiplex StaRT-PCR primer which can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                       Sequence
                                                                                                                              used for detecting the presence of allergies and for screening for treatments. The present sequence represents a PCR primer for mouse beta-
actin, which is used in an example from the present invention.
                                                                                                                                                                    detecting allergies; (2) method for screening for treatments for allergies; and (3) a kit for screening for treatments. The method can
                                                                                                                                                                                             The present invention describes a method for detecting an allergic disease using SOCS3 as a marker. The method comprises determining the level of expression of the marker gene in the sample and comparing it with that of a healthy individual. Also described: (1) a reagent for
                                                                                                                                                                                                                                                                                      Detecting allergic disease using SOCS3 as a marker
                                                                                                                                                                                                                                                                                                                                         Nagata N,

                                                                                                                                                                                                                                                                               The sequences given in AAQ27805-7 are primers which are complementary to intronic sequences within the amyloid precusor protein gene (APP). They were used to amplify exon 17, APP encodes various isoforms which are precursors of beta-amyloid protein. The beta-amyloid protein is an approx. 4kD protein (39-42 amino acids) which is an internal cleavage product from APP. There are five distinct isoforms of APP containing 563, 595, 714, 751 and 770 amino acids. These are generated by alternative splicing of primary transcripts of APP which is located on human chromosome 21. The APP isoforms are glycosylated transmembrane proteins. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Beta-amyloid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A yeast artificial chromosome (YAC) was prepd. that contd. the gene fo amyloid precursor protein (ABP). The APP YACK was introduced into embryonic stem (ES)cells (AB-1). For the identification of ES clones contg. APP sequences, individual DNA samples were pooled in rows and columns for PCR, and the pools analysed for APP sequences by PCR, usin primers APP-PA, APP-PB2, APP-17A and APP-17B, which are adapted from Pidani et al., Human Molecular Genetics, 1, 165-168, 1992. APP-PA/PB2 denote primers specific for the promoter region of the human APP gene, APP17A,17B are specific for exon 17. (Updated on 25-MAR-2003 to correct and application of the sequences)

                                                                                                                                   This oligonucleotide comprises the 5' donor site of intron 2 of the mouse Huntington's disease (HD) gene (see also AAT78974). The splice site equences for the first 5 exons of the mouse and human HD gene were compared (see AAT78985-T79002). Targeted disruption of the murine HD gene, e.g. at exon 5, can be used to examine the function of the HD gene and its role in development. Transgenic mice can be used as models of HD

                                                                                                                                                                                                                                                                                                                               This invention describes a novel human transcriptional co-activator, CC designated cyclin T1 (also known as cyclin K), which interacts with the chuman immunodeficiency virus (HIV) Tat protein. Cyclin T1 is capable of participating as a constituent of the Tat-associated kinase ('TAK): Transcription elongation factor submit b (TEFP) complex. The polyapptide modulates Tat transactivation by enhancing the affinity of the Tat protein with the cis-acting transactivation response element ('TAR) RNA. Compounds identified by methods of the invention that disrupt the association of divalent cation metal(s) with cyclin T1 and/or Tat C protein are useful for the modulation of Tat transactivation in C biological systems. Cyclin T1, or antibodies spainst cyclin T1 can be used to treat a subject infected with HIV. Antibodies spainst cyclin T1 can be used as immunogens and also for studying tissue localization of protein C and complexes, for purification of inhibitors and are useful for c diagnostic applications. The probes and primers are useful for c identification and amplification of the cyclin T1 DNA. The transgenic calisate for tity infection

                                                                                                                                                                                                                                                                                                                                                            This is the nucleotide sequence of maize clpP gene primer clpP#3. The 5' nucleotide of the primer corresponds to nucleotide 70549 of the complementary strand of the maize plastid genome sequence. The primer was designed to add a XhoI restriction site downstream of an amplified clpP fragment following PCR amplification. The PCR product was cloned into vector pBSKS+ and used to generate protecting RNA for use in in vitro capping experiments. The invention provides isolated rpoB, atpB, clpP and 16S rDNA NEP and PEP promoter elements (see AAV99569-99) useful for producing exogenous proteins of interest in plant plastids
                                                                                                                                                                                                                                                                                                                                         Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            fragment from a mixture of nucleic acid fragments. The method comprises removing a non-target fragment by hybridising it to an immobilised "subtraction" oligonucleotide that is complementary to a sequence present in the non-target fragment but absent in the target fragment, repeating this step until a known sequence in the target nucleic acid is unique and then selecting the target fragment by hybridising to a complementary immobilised "selection" oligonucleotide. The method can be used in structure probing experiments to determine whether a given nucleotide is modified by a modifying agent, or whether a compound alters reactivity of a nucleotide in a test nucleic acid toward a modifying agent. The present sequence represents a cDNA transcript resulting from reverse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents human APP (amyloid precursor protein) exon 17-CC specific PCR primer APP-17B, used with PCR primer APP-17A (AAZ32686) to CC amplify exon 17 of the human APP gene in murine embryonic stem cells CC transfected via a novel method with a YAC (yeast artificial chromosome) CC containing the human APP gene. The novel method of transfection produces CC a selectable co-lipofected mammalian cell incorporating multiple CC teterologous DNA species. It comprises forming a co-lipofection complex CC comprising a cationic lipid, a first polynucleotide larger than 50 kb, CC and an unlinked second polynucleotide comprising a selectable marker gene CC expression cassette, and transfecting mammalian cells with it. Both CC expression cassette, and transfecting mammalian cells with it. Both CC electable co-lipofected mammalian cells which contain incorporated CC multiple heterologous DNA species. The method can be used for transferring large segments of DNA, such as large YAC clones, into CC mammalian cells such as embryonic stem cells. The methods can be used for transgenic animals as models for Alzheimer's disease. The methods can be used to produce transgenic animals as models for Alzheimer's disease. The methods can

The protein is recognised by a monoclonal antibody (MAb) secreted by the hybridoma AV37 deposited at the European Collection of Cell Cultures (ECACC) accession number 98030304. The polypeptide can be used to isolate a MAb, produce a hybridoma producing the MAb, and in a composition for use as a vaccine a hybridoma producing the MAb, and in a composition for use as a vaccine. The vaccine can be used against oncogenic avian viruses, including Marek's disease virus, avian leucosis virus. Rous-associated virus and reticuloendotheliosis virus. The vector
                                                                                                           includes DNA and protein sequences for the receptor (AAC61078 and AX885916). Also included in the invention is an antibody specific for the murine nurse cell receptor. DNA encoding the receptor can be used to detect Digeorge's syndrome. The present sequence represents a primer used in the isolation and characterisation of the receptor of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 22 BP; 2

                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel heat-inducible promoter (1). (1) is used to express foreign genes in fungi, particularly yeast and specifically Hansenula polymorpha, especially proteins that require glycosylation and can not be expressed in bacteria. (1) is active even at high temperature, allowing yeast to be cultured at higher than normal temperatures with reduced contamination by other microorganisms and reduced need for expensive cooling. (1) is selectively activated by heat (it contains no general stress-responsive elements), so permits expression of foreign genes to be suppressed during selected stages of growth, resulting in less injury to cells and biomass. This sequence represents a primer used in the isolation of the trehalose-6-phosphate synthase TPS1 gene from Hansenula polymorpha. (Updated on 15-SEP-2003 to standardise OS field)

The invention relates to novel GABAB subtypes GABAB-R1c and GABAB-R2 (see AAY79202). It also relates to variants of the receptors, nucleotide sequences (see AAZ94168) encoding the receptors, vectors, stable cell lines, antibodies, screening methods of receptor production, methods of treatment or prophylaxis of a disorder that is responsive t modulation of GABAB receptor activity. The disorder is especially a central nervous system disorder, a gastrointestinal disorder, a lung disorder or a bladder disorder, especially spasticity, epilepsy, alzheimer's disease, pain or an affective or feeding disorder (claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GABA-B receptor subtypes useful for identifying modulators of GABA-B receptor activity that may be used for preventing and treating diseases including Alzheimer's disease, epilepsy and spasticity.
